TITLE: Real noise rejection in the reception of tele-signals and ways to enhance it
by adaptation

SOURCE: Nauchno-tehnicheskaya konferentsiya po sredstvam promyshlennoy
telemekhaniki. Moscow, 1963. Promyshlennaya telemekhanika (Industrial
telemechanics); materialy konferentsii. Moscow, Izd-vo Energiya, 1966, 98-109

TOPIC TAGS: remote control system, telemetry system, signal noise separation

ABSTRACT: The nature of noise in tele-systems using h-v power lines as carrier
channels is examined; transmission-adaptive systems are discussed in general
terms. Estimated and experimental noise-distribution curves (duration vs. noise
level) for an EPO-400 h-f tele-station are shown. An experimental noise
(42-124 mv) vs. time (0-2000 sec) curve exhibits fast and slow noise-level
variations; the noise was measured on a carrier channel connected to a 400-kv power

Card 1/2

L 37662-66

ACC NR. AT6012347

line. The noise level is clearly correlated with the amount of power transmitted by the line. The effect of noise level on the flow of errors in the tele-channel is briefly discussed. Usually, the rate of information transmission decreases when the noise level increases, which may result in an operational paradox: the information flow may stop (under system emergency conditions) at the moment when the information is most needed. Hence, the transmission process proper should be automatically optimized; a transmission-adaptive system matches the end-apparatus parameters with the variable traffic capacity of the channel. The adaptation efficiency can be evaluated by: (a) the decrease in the number of errors against the decreased transmission rate and (b) the decrease in apparatus reliability as a consequence of the increased apparatus redundancy. Orig. art. has: 7 figures and 1 formula.

AUTHOR: Bukshpan, T.Ya., Engineer

307/111-59-8-7/30

TITLE: An Automatic Technical Control Station

PERIODICAL: Vestnik svyazi, 1959, Nr 8, pp 5-7 (USSR)

ABSTRACT: The article describes the equipment of a technical control station in operation in the Moskovskaya gorskaya radiotranslyatsionnaya set' (Moscow Municipal Radio-Relay Network) allowing continuous automatic control of the broadcasting circuits in the system; quality control is also possible with this equipment, installed at the Tsentral'naya usilitel'naya stantsiya (Central Repeater Station) (TsUS) of MGRS. The equipment was developed and manufactured at the MGRS. The author states that in 1953 a system for remote measurement of circuit quality indices was introduced in the MGRS as a first step in program control. Basic to the new control system is a balanced device, called an electric ratiometer, and described by V. A. Nyurenberg (Vestnik svyazi, 1959, Nr 2), for comparison of the voltage level in two channels (one

Card 1/3

An Automatic Technical Control Station

SGV/111-53-8-7/30

level being taken as standard). Theory of operation is briefly outlined, and operation of the radiometer is described; some specifications are given. Operation of the entire apparatus (diagram Fig 1) consisting of 3 sets of balancing devices, is outlined; control of the operating TsUS channel, and all subordinate repeater station channels and block station channels is provided for; sub-station channels are switched into the circuit one after another in a regular cycle. Also provided is checking for frequency distortion in the sub- and block station channels by means of comparison with the frequency characteristics of the TsUS channel; this operation is also outlined. Pulse meters in the apparatus provide for checking transmission levels at the input and output of the TsUS channels (described). Remote measurement of quality indices of the broadcasting circuit is accomplished using a ZG-10 audio generator, an ADI remote measuring device, and a measuring amplifier. Non-linear distortion is measured at a frequency of 400 cps, frequency character-

Card 2/3

An Automatic Technical Control Station

SOV/111-59-8-7/30

istics from 50-10,000 cps, and noise level to -60 db. This equipment is briefly described, and the measuring process outlined. Included in the station apparatus are a number of cathode follower buffer amplifiers used in measuring and checking low voltage circuits. The installation of the control station equipment (which also includes an LV-9 measuring instrument) is briefly described and illustrated (Fig 2). Supplementary equipment, presently in experimental service, is provided for checking the condition of the distribution feed lines. There is 1 photograph and 1 schematic diagram.

Gaseous Fuels

"Propane-Butane Fractions of Petroleum Gases as Fuel in Internal Combustion Engines," I. D. Bukshpu "Energet Byul" No 7, pp 1-3

Describes advantages of using propane-butane compressed gases as fuel in locomotives and automobiles. Calls for study of whether present automotive equipment is suitable for this type fuel. Suggests it may be desirable to build special engines for this purpose. States that a large number of Ukrainian plants, specifically at Kiev,

PHASE I BOOK EXPLOITATION

378

Biryukovich, Mikhail Mikhaylovich, and Bukshpun, Marat Yakovlevich

Sudovaya radiolokatsionnaya stantsiya "Neptun" (The Ship Radar Installation "Neptune") Moscow, Izd-vo "Morskoy transport", 1957. 203 p. 9,000 copies printed.

Ed.: Chernyayev, R. N.; Ed. of Publishing House: Kolchinskiy, M. L.; Tech. Ed.: Tikhonova, Ye. A.

PURPOSE: This monograph is addressed to ship navigators who are acquainted with the fundamentals of radio engineering and to specialists attached to the ship's navigation room.

COVERAGE: The monograph is concerned with the operation and design principles of the ship radar installation "Neptune". Methods of adjusting its component units and of detecting and correcting defects are described. The "Neptune" radar equipment is standard on many ships of the Soviet seagoing fleet (p.3). This book was composed on the assumption that the ship's navigator must understand the operating principles of the radar installation as a whole, as well as of its separate units if he is to be able to operate Card 1/12 radar equipment properly, and to make repairs at sea,

The Ship Radar Installation "Neptune"

378

or in foreign ports where it is very often impossible or difficult to find radar specialists in emergencies. Considerable attention is given in the book to methods of tuning and adjusting radar units and aggregates of radar units. Circuit diagrams of the master indicator, of the receiver-transmitter and of the antenna as well as of the remote indicator are given. These circuits, however, are not described in detail, but are given only to aid the reader to see the interrelation between the separate units. Soviet-produced electrical, electronic and mechanical parts and components entering into the completely assembled radar unit and its accessories are mentioned or discussed at length throughout the monograph. It is pointed out that since publication of this book, the "Neptune" radar equipment may have undergone certain modifications. For this reason the diagrams given in the book may be somewhat different from those in the radar equipment actually being produced. Extensive tables of characteristics of various types of tubes and of other components are given. The basic design parameters and characteristics of the "Neptune" radar and its components are given in tabular form (pp.16-18). The book is accompanied by a set of six inserts

AUTHOR: Bukshteyn, D.I., Engineer; Mikhaylov, V.G., Candidate of Technical Sciences..

TITLE: Economic Evaluation of Precast Reinforced Concrete Constructions - Details and Products. (Metod ekonomicheskoy otsenki sbornykh zhelezobetonnykh konstruktsiy, detaley i izdeliy)

PERIODICAL: Beton i Zhelezobeton, 1958, No. 5, USSR, Pp 170-174.

ABSTRACT: The method of cost of reinforced concrete constructions was worked out by V.A. Bushkov, Ya.A. Novikov, K.E. Tal', K.K. Antonov and E.I. Varenik. Formulae for the calculation of cost of precast reinforced concrete products are given and explained. The method of costing of various constructions is studied in the Nauchno-Issledovatel'skiy Institut Ekonomiki Stroitel'stva (Scientific Research Institute of Construction Economics, ASIA USSR) by Candidate of Technical Science S.K. Lazarevich. Formulae for cost of concrete mixes are given and explained. Table 1 gives transition coefficient from the geometric volume of the product to the volume of the concrete mix and Table 2 gives cost of concrete mix and consumption of cement. Formulae for the pricing of steel reinforcement is also given as well as the cost of

Card 1/2

Economic Evaluation of Precast Reinforced Concrete Constructions - Details and Products.

bending of the reinforcement. Table 3 gives the weight coefficient of the steel; Table 5 the cost of prestressing the reinforcement and Table 6 the same but in roubles per kg. Table 7 gives cost of the steel and cost of production of basic details. Formulae for casting and steam curing of products is included. Table 8 gives cost of casting and curing works. Table 9 gives cost of prestressed reinforced ribbed roofing slabs PKZhN-1 for industrial buildings. Problems of the selection of optimal technological processes for production were investigated at Giprotis by Engineers S.V. Filimonov and P.M. Sushkov.

Stal'nyye kanaty; spravochnoye rukovodstvo (Steel Wire Rope;
Reference Manual) Moscow, Metallurgizdat, 1959. 150 p.
Errata slip inserted. 4,600 copies printed.

Ed.: N. V. Manakin; Ed. of Publishing House: A. L. Ozeretskaya;
Tech. Ed.: V. V. Mikhaylova.

PURPOSE: This manual is intended for foremen and personnel working
with wire rope.

COVERAGE: The book describes types and designs of wire rope.
Recommendations are made for designs for strength, calculations,
and selection of wire ropes for different industrial purposes.
Methods of attaching ropes and examples of correct splicing
procedures are presented. Directions are given for the mounting,
inspection, maintenance, and use of wire rope. No personalities
are mentioned. There are no references.
